L04 Contribution Journal

I completed the Module 04 notebook independently and wrote my own reflection journal and this contribution journal. I also handled the group's submission for this lab.

Before starting, I realized that some cells in my notebook wouldn't run correctly. The first cell had a syntax error. The problem was that the line breaks were missing throughout the file so every cell would collapse into a single line, so I repaired the file before beginning. I then ran all the cells and reviewed the outputs.

For Experiment 1, I created a countplot of survival by port of embarkation. I found that Cherbourg was the only port where more passengers survived than died. Then I ran a temporary crosstab of port against passenger class, which revealed that Cherbourg boarded more first-class passengers. For Experiment 2, I created a boxplot that compared fare distribution by survival. Then I labeled the axes, so the two groups were readable. I wrote insight statements for both experiments in my own words, then answered the three Knowledge Check questions.

Lastly, I ran all cells to ensure the outputs were correct, then exported the notebook, wrote my reflective journal, and assembled the group's deliverables into the repository for submission.

Diane Lenhoff

Lab 04 Contribution Journal

For Lab 04, I worked through the entire Titanic Exploratory Data Analysis notebook and completed the required code, activities, experiments, and analysis sections. I ran the code as I went and reviewed the outputs and visualizations to make sure everything was working correctly.

I completed the experiments analyzing the port of embarkation and the relationship between fare and survival. I also completed the knowledge check and reflection questions based on what I learned from the lab.

I worked with my team members to discuss the lab, compare our results, and help each other when we had questions or problems with the code.

My contribution focused on completing my portion of the notebook, understanding the EDA concepts, analyzing the results, and participating with the team. I did not coordinate or put together the final Lab 04 team submission.

Member: Elquin

For Lab 04 (Exploratory Data Analysis – Titanic Dataset), I completed the following sections of the group notebook:

1. Experiment 1 – Port of Embarkation: Wrote and ran the countplot code to visualize survival counts by port of embarkation (Embarked column), comparing Cherbourg, Queenstown, and Southampton, and wrote the accompanying insight about the pattern observed.

2. Experiment 2 – Fare vs. Survival: Wrote and ran the boxplot code comparing fare distributions between passengers who survived and those who did not, and wrote the accompanying insight about the relationship between fare and survival.

3. Knowledge Check: Answered all three reflection questions in the notebook's markdown cell, covering the goal of EDA, the profile of passengers with the highest survival chance, and why visualizing data matters beyond summary statistics.

I ran the full notebook end-to-end to confirm all cells executed successfully and all outputs/plots displayed correctly before exporting.

Contribution Journal

To contribute to this week's assignment, I ran through all of the cells of Lab 4 and took notes, studied, and explored the data provided by the Titanic dataset. I made sure to complete any "code here" sections of the lab, plotted when necessary, and answered the knowledge check-in questions at the end of the markdown. Secondly, I recorded the experience in a reflective journal entry and then sent the required documents to be turned in.

Module 4 Lab Contribution Journal

For this week's assignment I contributed to the group by working through the entire notebook. I took time to understand the relationship between the port of embarkation and survival rates and analyzed the distribution of fares as it related to survival. I answered all four knowledge check questions in the lab based on what I learned working through the notebook.
